molecules.Internalized molecules are sequestred to the trans-Golgi network (TGN). Also decreases cell surface CD4 antigen by interacting with the Src family kinase LCK thereby inducing LCK-CD4 dissociation and by increasing clathrin-dependent endocytosis of this antigen to target it to lysosomal degradation. Peroxisomal acyl-coenzyme A thioseter hydrolase I (PTEI) seems to be involved in this process (By similarity). May serve as a direct bridge between CD4 and the cellular endocytic machinery by interacting with beta-COP and adaptins. In consequence, surface MHC-I and CD4 endocytic pathway.";

-- FUNCTION: Early protein that seems to play a role in optimizing the host cell environment for viral replication without causing cell death by apoptosis (By similarity). Enhances virus infectivity and pathogenicity.

-- FUNCTION: Down-modulates surface MHC-I molecules through the PI3-Kinase-mediated ARF6 endosomal pathway. Combines with PACSI and accelerates the ARF6-dependent internalization of MHC-I

- - similarity).
 - PTM: Myristoylation is essential for inner plasma membrane targeting of Nef and virion incorporation and thereby for infectivity. Also required to reduce CD4 expression at the cell surface (By similarity).
- PTM: Phosphorylated on serine residues, probably by host PKC (By similarity)
- MISCELLANEOUS: In this isolate a mutation in position 124 adds a stop codon and the protein is much shorter than in other isolates (210 AA).
- SIMILARITY: Belongs to the lentiviruses Nef protein family. CAUTION: In clone pNL4-3 (AC P03406), it has been show that down-modulation of surface MHC class I molecules is independent of ARF6 endosomal pathway.
